KE0006 keyes prototype extension board red environmental protection

Overview:

UNO R3 expansion board

The keyes prototype expansion board is an expansion board used in conjunction with the Keyes UNO R3 development board. It is used to build a circuit prototype. You can solder components directly on the board or connect the circuit through the mini breadboard on the board. The breadboard and the circuit board are connected by double-sided tape. When sold, the breadboard and the circuit board are separated.

The keyes prototype expansion board has a reset button and a power indicator, which can be used directly. All pins and power have been drawn out, which is very suitable for building circuit prototypes with Arduino.
